THE SIAM SOCIETY.

(FOUNDED 1904.)

For the Investigation and Encouragement of Arts, Science and Literature in relation to Siam, and neighbouring countries.

PATRON:
HIS MAJESTY THE KING.

VICE-PATRON:
HIS ROYAL HIGHNESS, PRINCE DAMRONG RAJANUBHAB.
Minister of the Interior.

COUNCIL IN 1912.

PRESIDENT:
O. FRANKFURTER, PH. D.

VICE-PRESIDENTS:
W. R. D. BECKETT, O.M.G.
T. MASAO (PHRAYA MAHIDHARA), D.C.L., LL.D.
P. PETITHUGUENIN.

HON. SECRETARY:
B. O. CARTWRIGHT, B.A.

HON. TREASURER:
W. H. MUNDIE, M.A.

MEMBERS OF COUNCIL:
R. BELHOMME, B.A., B.A.I., A.M.I.C.E.
J. CROSBY.
K. DÖHRING, DR. ING.
F. H. GILES.
H. CAMPBELL HIGHET, M.D.
C. A. S. SEWELL, M.A.

List of the Commoner Birds
found in Siam.

WITH THE CORRESPONDING SIAMESE NAMES.

List of the Commoner Birds found in Siam.

WITH THE CORRESPONDING SIAMESE NAMES.

Mr. Crosby's Translation of the "Book of the Birds" (Siam Society, Journal, Vol. VII., Part 2) has, I believe, evoked some interest in the birds of Siam. Seeing that there are some few errors in the Ornithological or English names mentioned by Mr. Crosby, he asked me to prepare a list of the Siamese names I had heard while working in various parts of the country.

Oates in his "Birds of British Burmah" prefaces his list of Burmese names with the remark that "the natives of Burmah have names for only those birds which, from their size, abundance, gaudy plumage or other peculiarities attract notice." This is practically true of every country; but in European countries the migratory birds usually arrive in their best plumage and display greater vocal powers than when wintering in Southern climes; and also in Northern countries their annual re-appearance is far more defined and certain and thus more clearly connected with seasonal change than when coming South after the troubles and trials of family life. Thus in Northern countries the Migratory birds are far better known in the countryside than in Siam. For the 800 genera and species of birds mentioned by Oates he has gathered together some 108 Burmese names. In the present quite incomplete list I have obtained some 90 names, but there are repetitions among these. The names I give are the popular names in the country. More names can, I believe, be obtained at the Museum, but I think they are names not well known to the Siamese. Many Siamese in Bangkok are acquainted with names well known in fable, legend and song, but descriptions are not forthcoming.

In this list the numbers and ornithological names refer to "Birds of British Burmah," 1882, by Eugene Oates. These two volumes describing some 800 birds practically contain all the birds

resident in or migrating to Siam. But to persons unacquainted with the natural orders of Birds and, most difficult of all, the general features of the species of Passerine birds, Oates' book is wearisome, for birds can only be found by a process of elimination.

To persons interested in the study of birds, I would recommend C. McGregor's "Manual of Philippine Birds," to be obtained from the Bureau of Science, Manila. With this at hand classification becomes easy, and a large number of the Passerine birds are common to both countries.

Oates' book can be obtained in London at a cost of about £1, and the price of McGregor's book is 8 Philippine dollars.

In the following list I have also shortly described some of the commoner and a few of the rarer birds for which there are no local names, but which sportsmen and others may meet in their travels; and I have also described at some length the 5 genera of snipe as being of interest to the majority of persons resident in Siam.

Seeing how very little is generally or publicly known of the resident or migratory birds in Siam, I hope that this may be considered as a preliminary to further Lists published by the Society at intervals.

As an indication of what may be done in Bangkok alone, I might mention that with the aid of an air gun a small boy collected for me nearly 40 specimens in the months of November and December 1911. These 40 specimens included 29 species, of which only 3 were migratory, viz:—the Golden and Lesser ringed plovers and the Chinese Mynah.

When working up country it is frequently difficult, especially in the rains, to preserve skins of birds. In such cases the following measurements and particulars should be taken as an aid to identification. With the specimen laid flat on its back the length (1) from tip of beak to tip of tail should be taken, (2) length of tail, (3) length of wing from bend of wing to tip of longest primary, (4) the tarsus, (5) the length of beak (i) from gape to tip (ii) from nostril to tip. Then also, in addition to a description of the coloration, the shape of the beak and the formation of the Tarsi and feet are important. The Passerine order of birds can be immediately separated into two sub-orders by an examination of the Tarsi.

(a). Tracheophonae. The Pittas, a small family of most beautifully coloured birds of thrush-like appearance, inhabiting as a rule the darkest evergreen forest, and also the Broadbills. In this sub-order the tarsus has its hinder portion somewhat compressed, but the posterior edge is rounded and entire. (b) The Oscines, which includes the whole of the remaining Passerine Order; in which the Tarsus may have its hinder portion compressed and forming a sharp edge; or else the hinder face will be rounded and distinctly divided by transverse joints.

The Oscines may have the Tarsus "booted," as in the Turdidae, Sylviidae, etc., or it will be "scutellate" as in the Larks, Finches and many other families. The length and direction of the bristles about the mouth should be noted and the cutting edges of the bill may be notched or serrated. In the wing the length of the primaries should be noted—whether the 1st, 2nd, 3rd, or 4th is the longest, or the 1st may be rudimentary.

In describing the plumage the following terms are usually used:—

"Spotted" feathers have the tip a different colour to the remainder of the feather.

"Streaked" feathers have the web next the quill a different colour to the remainder of the feather.

"Barred" feathers have transverse bars of a different colour to the remainder of the feather.

"Margined" feathers have one or both margins a different colour to the remainder of the feather.

The majority of the birds described in the following List have been obtained or observed in the area bounded by North Lat. $12^{\circ} 40'$ to $13^{\circ} 10'$ and East Longitude $99^{\circ} 10'$ to $99^{\circ} 40'$, which area includes the sources of the Patchaburi and Pran rivers. The ground level rises from about 70 metres to the highest point on the border range of 1500 metres. The forest and jungle is dense throughout, but East of $99^{\circ} 25'$ is comparatively dry jungle, containing a good deal of deciduous timber; all West of that line being evergreen jungle with perennial streams running in the valleys. The whole district is practically

uninhabited save for one or two small settlements of Karangs, and the only open spaces in the area are the small patches cleared for cultivation by these people in the bigger valleys. The outline of the country is sharply cut and the majority of the mountains and spurs run directly down to the streams at an angle of 20 to 60°, the valleys being deep, dark, and damp.

The most noticeable birds in the district are the Hornbills; but I was surprised to find small Passerine birds apparently enjoying life on exposed mountain ridges of 3000 and 4000 feet elevation in a cold damp climate, where the higher ridges were enveloped in cloud for 14 days without a break during July; the atmosphere being so thick that it was impossible to see any object clearly at more than 40 yards distance.

Hill partridges were plentiful at the highest elevations, but I never obtained the Silver pheasant at a greater elevation than 700 metres, or the Grey Peacock pheasant at above 500 metres. The latter appears to be only locally plentiful; as it was trapped in considerable quantities in some valleys and never found in others. I do not agree with Oates as to its being a shy bird:—the “sportsman” may find it hard to shoot, but to the hunter it falls an easy prey in the dry season on account of its very loud and oft repeated call.

In addition to the birds mentioned in the following List I have during the past season identified the following, for which there are no Siamese names:—

(3). Orange-headed Ground Thrush (var).

(385). Green breasted Pitta. This and another of the same family not yet identified, obtained in a deep valley, elevation about 400 metres.

(42). Tennasserim Shrike Thrush, on mountainous ridge about 900 m.

(516). Davison's Barbet, elevation about 1000 metres.

(486.) Yellow breasted trogon.

(483). *Anorrhinus Tickelli*. On the 7th August I came across a flock of Hornbills which appear to agree with Tickell's Hornbill; yet Oates states that this bird is only found East of Moulmein.

(466). The Pied Kingfisher. This is probably the commonest kingfisher in the country, but I have heard no distinctive name for it.

(462). The little Indian Kingfisher; may be obtained in Bangkok.

(677). Vieillots Fire Back Pheasant (var: erythrophthalmus). Recently I observed a male of this species in a dealer's in Bangkok and on enquiring the name was immediately informed that it was Nok Phya Loah, which is the Siamese name for the Grey Peacock pheasant (No. 673, Oates). The dealer could only tell me that it came from abroad. Oates states that this variety occurs in the Malay Peninsula and may occur in Tennasserim.

(251). The white throated fantail. Elevation 1000 metres.

K. G. GAIRDNER,
Sept., 1912.

ORDER: PASSERES.

Family, *Turdidae*.

Ornithl. Name	English Name.	Siamese Name, or Remarks.
10. <i>Monticola cyanus</i> .	Blue rock thrush.	นก กัง เเงา ปาก เรียว (Museum)
20. <i>Copsychus musicus</i> .	Malay Magpie Robin.	นก กะต้า ตาม หัว กัง เเงา คางเงา
		The sole difference between <i>C. musicus</i> and <i>C. saularis</i> (Mr. Crosby) is that the under wing coverts are white centred with black in the Malayan variety, and pure white in the Indian or Burmese.
21. <i>Cittocincla Macrura</i> .	The Shama.	นก กัง เเงา This beautiful song bird is in size and colour like the last but has the breast chestnut instead of white, and a longer tail.

Family, *Timeliidae*.

35. <i>Garrulax diardi</i> .	Siamese white crested laughing thrush.	นก กะ ถาง (Museum) อินทร์ หัวหงอก หัวขอ เจ๊ก โภหก (Popular names.) The Siamese bird differs from the Burmese only in the crest being grey and white.
------------------------------	--	--

Families, *Sylviidae*, *Paridae*, *Sittidae*, etc.

The small Warblers, Titmice and Wrens either resident in Siam or migratory here for the winter months, are usually spoken of as นก กะ คิบ

Family, Motacillidae.

157. *Limonidromus indicus.* The Forest wagtail. ? ນົກນູດໄດ້ (Mr. Crosby's translation of the Book of the Birds.)

150. *Motacilla Leucopsis.* Pied wagtail.

156. *Budytes calcaratus.* Yellow wagtail. } Both common in Bangkok during the winter months, but no local name apparently.

Family, Brachypodidae.

190. *Pyconotus blanfordi.* Blanford's or Ashy-fronted Bulbul. ນົກປ່ຽນກ ທີ່ນີ້ກ່ອນ this species may be easily recognized by the hairs springing from the nape and upper back.

197 *Aegithina viridissima.* Green dwarfbulbul, or ນົກວິນເຫັດອົງບ່ອນ This Black winged iora. is not a satisfactory local name as the same name is applied to all small birds with a yellow breast, and properly belongs to the Black headed Oriole.

205. *Irena puella.* Fairy blue bird ນົກປະດຳໄວເງິນ (Museum B'kok)

Family, Oriolidae.

208. *Oriolus melanocephalus.* The black headed Oriole. ນົກວິນເຫັດອົງບ່ອນ The golden oriole is common all over the country.

Family, Dicruridae.

212. *Buchanga atra.* The Black Drongo or King Crow. ນົກແຮງແຂງ This name is applied to all the members of this family.

218. *Dissemurus Paradiseus.* Great Racket Tailed Drongo. ນາແຈ້ງ ແຂວ້າ ມັງ

Family, Laniidae.

236. *Lanius nasutus.* Black headed shrike. ນາທັງເຕືອ

Family, Muscicapidae.

252. *Rhipidura javanica.* The Java Fantail. ນາກະກາດິນ ຍາກີນ ເຊັ່ນ ອາຍຸດີນ
Easily recognized from its habit of dancing about from branch to branch with tail out-spread. Sooty brown, lower plumage white.

Family, Hirundinidae.

293. *Hypurolepis javanica.* Tropical House Swallow. ນາອີ້ນ ແວ່ນ This name applies to all the swallows ; *H. javanica* is the only one I have so far examined.

Family, Nectariniidae.

303. *Cinnyris flammaxillaris.* Yellow breasted Sun bird. ນາກະຈົບ ແກດນ

Family, Dicaeidae.

314. *Dicaeum cruentatum.* Scarlet backed flower pecker. ນາສົ່ງ ພູ

Family, Fringillidae.

328. *Passer Indicus* (var *flavicollis*). Indian House sparrow. ນາກະຈົບກາເທິນ I have only once heard this local name given ; and this is also the slang name for the Ostrich.

329. *Passer Montanus.* European tree sparrow. ນາກະຈົບ ອອນ

Family, *Ploceidae*.

337. *Ploceus Baya*. The Baya or Weaver bird. ນົກ ດົກະຈາກ The male in winter loses the yellow plumage on the head and is then known as the "Paddy bird."

Family, *Alaudidae*.

348. *Alauda wattersi*. Formosan Skylark. ກວົດກ້າດນ

Family, *Sturnidae*.

352. *Gracupica nigricollis*. Black necked Mynah. ນົກ ກົງ ໄກສະ Both these birds are common in Bangkok, the former with a pure white head and rather larger than the second.

353. *Sturnopastor super ciliaris*. Burmese Pied Mynah. ນົກ ກົງ ໄກສະ

354. *Acridotheres Tristis*. The house Mynah. ນົກໂອງ ນຳ or ຕາດີກາ I have never seen this bird in Bangkok but it is common around villages up country. The Burmese name for the Talking Mynah is Tha-lec-gah (Oates.)

356. *Acridotheres Siamensis*. The Siamese Mynah. ນົກເຊີຍງ Black with a white patch on either wing, a common pet in Siamese houses.

359. *Sturnia Sinensis*. The Chinese Mynah. ນົກ ໄກສະ This bird is seen in small flocks from November to February only, and may be recognized from the soft grey and white plumage.

365. Gracula	The Burmese	ନନ୍ଦିନୀ
Intermedia.	Talking Mynah.	
366. Gracula	The Malay	ନନ୍ଦିନୀ
Javanensis.	Talking Mynah.	

I am unable to say which of these varieties predominate in Siam ; the latter is a more massive bird. The respective lengths are 11.6 and 12.5 inches.

Family, Artamidae.

369. Artamus	Swallow-shrike.	ନନ୍ଦିନୀ
Fuscus.		

Family, Corvidae.

370. Corvus Mac-	Indian Jungle	ନନ୍ଦିନୀ
rorhynchos.	crow.	
372. Corvus	Burmese House	ନନ୍ଦିନୀ
Insolens.	crow.	

I believe the same local name serves both birds. The Jungle crow is the larger, measuring 19" and the House crow 17.5 inches. The latter I have only noticed this year for the first time, in Pechaburi town.

Family, Eurylaemidae.

397. Eurylaemus	Horsfield's	(Museum, Bangkok).
Javanicus.	Broadbill.	

400. Corydon	Dusky Broadbill.	I have seen and obtained two pairs of these birds in dense Forest ; and apparently there is no Siamese name
Sumatranaus.		

The bill is as wide at the gape as it is long.

II. ORDER: MACROCHIRES.

Family, *Caprimulgidae*.

414. *Caprimulgus asiaticus*. Common Indian Nightjar. นก นาค้าง Very common, call like a stone scudding over ice.

419. *Lyncornis Cerviniceps*. Burmese Eared Nightjar. นก ป่าก ကြော် Found only in hilly or forest country. Call a plaintive "Pee Pew."

III. ORDER: PICI.

Of the 30 odd genera of Woodpeckers inhabiting Siam I cannot remember having heard any distinctive names for the various genera. The general name is นก พี ชာရုံ

IV. ORDER: COCCYGES.

Family, *Upupidae*.

454. *Upupa longirostris*. Burmese Hoopoe. นก ชာရုံ Common in open jungle.

Family, *Meropidae*.

458. *Merops philippinus*. Blue tailed bee eater. นกตับကာ This is the only name I have heard for the various bee eaters.

Family, *Coraciidae*.

460. *Coracias affinis*. Burmese roller or "Blue jay." นก တုရုပု

Family, *Alcedinidae*.

The common name for all Kingfishers (14 genera) is นก กิน ပုဇွဲ

468. *Pelargopsis Burmanica*. Burmese Stork-billed Kingfisher. นก กิน กုန် The biggest of the heavier Kingfishers, with blue back and mustard coloured breast.

471. Halcyon White-breasted King- นก กะทิม
Smyrnensis. fisher.

472. Halcyon Black-capped King- นก ปัก ดา
Pileata. fisher.

Family, Bucerotidae.

476. Dichoceros Great Pied Hornbill. นกกาหัง or นกเงือก This, the
bicornis. biggest of the Family, measures 51 inches long, and is easily recognized by the creaking of its wings when flying and its call, a loud staccato bray.

478. Anthracoceros Small Pied Hornbill. นกเงือก Length 28 ins.
Albirostris. Common in all forest jungle.

480. Rhytidoceros Malayan Wreathed นกเงือก Length, 40 ins.
undulatus. Hornbill.

Family, Cuculidae.

491. Cuculus Banded Bay Cuckoo. Length 9.5. Black
sonneratii. barred with Chestnut. I obtained one of these 27/12/11 in Bangkok for the first time. No local name.

497. Chrysococcyx Emerald Cuckoo. นกนิว (Museum, B'kok.)
maculatus.

502. Eudynamis Malayan Coöl นก ก่า เหว่ or นก เหว่ Frequently caged as a pet in
malayana. Siam.

509. *Centrococcyx intermedius.* Burmese Coucal or Crow Pheasant. မြန်မာကုပ္ပန် (Burmese name မြန်မာ ပုဂ္ဂိုလ် "Bote"). The country folk credit this bird with calling at regular intervals during the night, viz., the 1st, 2nd, 3rd and 4th watches.

510. *Centrococcyx bengalensis.* Lesser Coucal. မြန်မာ ကုပ္ပန်

Family, Capitonidae.

514. *Cyanops Hodgsoni.* Lineated Barbet. မြန်မာ ဘုရားကုပ္ပန် The loud and wearisome note of this bird is well known to travellers in the jungle. An incessant "ko-poh, ko-poh" throughout the day.

519. *Xantholaema haemacephala.* Crimson gorgeted Barbet or "Coppersmith." မြန်မာ တိမ်ဝါယံ Common in garden land.

V. ORDER: PSITTACI.

526. *Palaeornis Cyanocephalus.* Burmese rose-headed paroquet. မြန်မာ ကောက် Length, 13.5".

528. *Psittinus incertus.* Malayan Parrot. မြန်မာ ကျင့် Length, 7.5".
Mr. Crosby's မြန်မာ ဗျားတော် I have not yet identified.

VI. STRIGES.

Family, Bubonidae.

534. *Bubo orientalis.* Horned owl. မြန်မာ ဘုရား နှင့် ဘုရားဘုရား
533. " *nipalensis.* Forest horned owl. မြန်မာ တံ့သံပုဂ္ဂိုလ်

Length 18"

Length 24"

536. *Scops lettia.* Nipal Scops owl. Length 9"

537. *Scops lempiji.* Horsfield's Scops owl. မြန်မာ ဘုရား ဘုရားဘုရား နှင့် ဘုရားဘုရား
Length 7½"

541. *Glaucidium brodiei* Collared Pygmy owl. นกเค้าแมว Length 6.3"

546. *Strix flammea*. Barn owl. นกเขตร ก Length 14.5"

All the eared owls are spoken of as นกแมว

VII. ACCIPITRES.

Family, *Vulturidae*.

549. *Pseudogyps bengalensis*. Indian white backed Vulture. อิ้น แวง

550. *Otogyps calvus*. Black Vulture. อิ้น แวง เจ้า พะย่า

Family, *Falconidae* (อิ้น เหยี่ยง)

551. *Circus melanoleucus*. Pied Harrier. This black and white harrier is frequently seen at the Sports Club in winter months.

The Eagles. นก อินทร์ บีบี 一般 name.

558. *Accipiter nisus*. Sparrow hawk. อิ้น เหยี่ยง นา เจ้า

568 *Spilornis cheela*. Crested serpent eagle. นก อิ้น รัง Length 26".

575. *Haliastur Indus*. Brahminy kite. อิ้น เหยี่ยง แคง

576. *Milvus affinis*. Smaller house kite. , , กำ

577. *Milvus melanotis*. Large jungle kite. , , กำ

578. *Elanus Caeruleus*. Black-shouldered kite. อิ้น เหยี่ยง นา เจ้า This beautiful grey and white bird I obtained only in Dec. 1911 in Bangkok.

581. *Baza Lophotes*. Black-crested kite falcon. A flock seen in Bejuburi, 1910.

584. *Microhierax fringillarius*. Black-legged falconet. อิ้น เหยี่ยง ไก่ Length 6"

589. *Tinnunculus alaudarius*. Kestrel. Black and white. อิ้น เหยี่ยง ยูบัว

Sub-Order: Pandiones.

591. Pandion The Osprey. မန ဝေါး Oates states that
Haliaëtus. this is probably only a winter visitor to Burmah. I have shot it and observed others in April and May.

VIII. STEGANOPODES.

Family, *Phalacrocoracidae*:

602. *P. carbo*. The large Cormorant. length 32" { អកករានា, both
 604. *P. Pygmaeus* The little Cormorant. " 20" to be met with in Nongs
 and streams up-country.

Family, Pelecanidae.

606. *P. Manillensis*. Spotted billed Pelican. 607. *P. Roseus*. Eastern white Pelican. မျှ ပူး၃၂ I have only seen one pair in Ratburi; but they are said to be common in that district during the rains.

IX. HERODIONES.

Family, Ardeidae.

608. Ardea Cinerea.	The Grey or Common Heron.	ນກ ກາ ໄກສາ This name ap- plies to all Herons.
609. Ardea Sumatrana.	Great Slaty Heron.	? length 50"
616. Bubulcus coromandus.	Cattle Egret.	ນກຍາງເສວຍ
617. Ardeola Grayi.	The Pond Heron.	ນກ ຂາງ
621. Ardetta Cinnamomea.	Chestnut bittern.	ນກ ຂາງ ກຽວກ

Family, Ciconiidae.

626. <i>Leptoptilus</i> Argala.	Adjutant bird.	នំអេក្រាំង Length 60 inches
627. " <i>javanicus.</i>	Lesser do.	" 54 "

628. *Xenorhynchus asiaticus.* Black-necked stork. អក កក ពេធ (Cartwright)

អក សាយ ប៉ុ Pachin. There is one of these in the possession of Mr. W. G. Johnson, obtained as a nestling in 1909 at Beja-buri. Length 52".

629. *Dissura episcopus.* White-necked stork. អក កក ពេធ មាតប

{ Fairly common in Rat-buri; length 36"

អក គុណ ការ

Family, Tantalidae.

630. <i>Anastomus oscitans.</i>	The shell ibis.	អក ប្រក ទោះ
631. <i>Tantalus leucocephalus.</i>	Pelican ibis.	ខំណុំ ខំយ ហ្មូច គុណប៉ុ white with black about body.
632. <i>Ibis melanoccephala.</i>	White ibis.	កំពើក ខំយ white with black head.
— <i>Ibis gigantea.</i>	Thawmat Ibis.	I have only seen one of these; if found the skin should be preserved as it is a very rare bird. Dark brown; blue head.

X. ANSERES.

Family, Anatidae.

635. <i>Nettapus coromandelianus.</i>	Cotton Teal goose.	អក គុប កក Length 13"
636. <i>Dendrocygna javanica.</i>	Lesser whistling teal	អក យេំ ក ឃា Length 16"
647. <i>Querquedula circia.</i>	Garganey teal.	A pair shot at Potaram, Ratburi, in Feb. 1908. No local name.

XI. COLUMBAE.

Family, *Columbidae*.

651. <i>Turtur</i> <i>Tigrinus.</i>	Malay spotted dove.	ນກ ໄຕຕ
654. <i>Turtur</i> <i>humilis.</i>	Eastern ruddy ring dove.	ນກ ເງວ ໄກ
658. <i>Geopelia</i> <i>striata.</i>	Barred ground dove.	ນກ ເງວ ຂະ ວາ
660. <i>Carpophaga</i> <i>aenea.</i>	Imperial green pigeon.	ນກ ເງວ ເປດ້າ
650. <i>Aleocomus.</i> <i>Puniceus.</i>	The Purple wood pigeon.	ນກ ດຳກູ
665. <i>Treron</i> <i>nipalensis.</i>	Thick-billed green pigeon.	The 5 or 6 green pigeons occurring in Siam are all called ນກ ເງວ ເງື່ອນ. This is the most common.

XII. GALLINAE.

Family, *Phasianidae*.

671. <i>Pavo muticus.</i>	Burmese peafowl.	ນກ ຢູ່ງ
672. <i>Argusianus</i> <i>Argus.</i>	Argus pheasant.	ນກກວ້າ Plentiful in the Malay Peninsula.
673. <i>Polyplectron</i> <i>thibetanum.</i>	Grey Peacock pheasant.	ນກພະຍາດ່າ This and the next are common in the dense evergreen forests of Tennasserim border.
674. <i>Euplocamus</i> <i>lineatus.</i>	Lineated silver pheasant.	ນກໄກພໍາ

675. <i>Euplocamus</i> <i>cuvieri.</i>	Arrakan silver pheasant.	These also occur, but I have heard no distinctive names for them.
676. <i>Euplocamus</i> <i>andersoni.</i>	Anderson's silver pheasant.	
677. <i>Euplocamus</i> <i>vieilloti.</i>	Vieillot's Fireback pheasant.	
678. <i>Gallus</i> <i>ferrugineus.</i>	Common jungle fowl.	ໄກປ້າ

Family, Tetraonidae.

679. <i>Francolinus</i> <i>chinensis.</i>	Chinese Francolin.	ນກກະກາ
684. <i>Caloperdix</i> <i>oculea.</i>	Ferruginous wood Partridge.	ນກກະກາ This bird's loud note is frequently heard in the dense evergreen forests on the Tennasserim border.
685. <i>Rollulus</i> <i>Rouloul.</i>	Red crested Hill Partridge.	Same local name as the last.
689. <i>Turnix</i> <i>maculosa.</i>	Blanford's button quail.	ນກຄົນ

XIII. GERANOMORPHAE.

Family, Rallidae.

694. <i>Rallina</i> <i>Fasciata.</i>	Malay Banded Rail.	ອົດັນຫົວໄກ້ນາ
700. <i>Erythrura</i> <i>phoenicura.</i>	White-breasted waterhen.	ນກແຂວກຫົວໜາກ
701. <i>Gallicrex</i> <i>cinereus.</i>	The Watercock.	ນກພົກ
702. <i>Porphyrio</i> <i>Poliocephalus.</i>	Indian Gallinule.	ອົດົງ This bird may be recognized by the hard red shield on the top of the head.

SUB-ORDER: ALECTORIDES.

Family, *Gruidae*.705. *Grus Antigone*. The Sarus crane.

ମନ୍ଦିରୀଯନ (incorrectly translated as the "adjudant bird" by Mr. Crosby).

This beautiful Crane (the only Crane in Siam) has a wide range, from India to Cochin-China. The colour is greyish blue, with a brick red head. Height, 55". Pairs are frequently kept in Bangkok. It is said to occur in the plains south of Pachin in large flocks during the breeding season (August).

ORDER XIV: LIMICOLAE.

Family, *Parridae*.708. *Metopidius Indicus*.

Bronze-winged jacana.

ମନ୍ଦିରୀଯନ Length, 10.5 in.
Usually found walking on floating plants in swamps.

The note is a peculiar bloop-bloop.

709. *Hydrophasianus chirurgus*.

ମନ୍ଦିରୀଯନ Chiefly white and occurs in flocks in February and March.

Family, *Charadriidae*.712. *Charadrius fulvus*.

Eastern Golden Plover.

ମନ୍ଦିରୀଯନ Common during the winter months only.

717. *Aegialitis dubia*.

Lesser ringed Plover.

Probably does not remain in Siam the year round, but common during the winter months. Length, 6.5 inches.

720. *Hoplopterus ventralis.* Spur-winged Lapwing. I have observed this in pairs in the upper reaches of the Bejaburi river, but there is no local name.

721. *Lobivanellus astronuchalis.* Burmese lapwing. ကျော်ဆုပ် တဲ့ ဂါ. The "did he do it?" is common everywhere.

726. *Scolopax rusticula.* Woodcock. This is probably called မော်မြေများ as are all the 4 following. I believe the woodcock occurs in the North.

727. *Gallinago coelestis.* Common Snipe. မော်မြေများ Length 10.5". Tail 2.4" Tail composed of 12, 14, or 16, ordinary soft feathers. Outer web of first primary white. Under side of wing indistinctly barred.

728. *Gallinago Stenura.* Pintail Snipe. Tail composed of 10 soft feathers, and on either side of these a number varying from 5 to 9 of narrow rigid feathers with apparently no webs.

Axillaries and under wing coverts very distinctly and regularly barred with dark brown throughout.

Outer web of first primary, same colour as inner web.

729. *Gallinago gallinula.* Jack Snipe. မော်မြေများ Length 8." Central pair of tail feathers project a short distance beyond the remaining 10. Back and scapulars glossy greenish black.

Gallinago	Wood snipe.	Length 12½ to 13"
nemoricola.		
730. Rhynchaea	Painted Snipe.	Length 10", Tail 1.7"
capensis.		Probably breeds in Siam.

XV. ORDER: GAVIAE.

XVI. ORDER: TUBINARES.

I know no names for the Sea Birds.

ORDER XVII: PYGOPODES.

Family, Podicipidæ.

780. *Tachybaptus* The little Grebe. Length 9"; no tail.
Fluviatilis. I believe this is called
ମାନ୍ଦିର ମୁହଁ

ADDENDA.

XI ORDER: COLUMBAE.

661. <i>Carpophaga</i> <i>Griseicapilla.</i>	Grey headed Imperial Pigeon.	မုန် မုန်. Head dove-grey chin white. Back and wing coverts rufous. Breast grey. Length 17½". Wing 9½". Call, very deep "k— woob—woom." A pair shot at an elevation of 3,500 feet. Lat. 12°40'. Tennasserim border.
657. <i>Chalcophaps</i> <i>Indica.</i>	The Emerald dove (Oates).	မုန် အော် မုန်. Head, neck, breast and under wing coverts deep chestnut. Tail maroon. Wing coverts, scaps, tertis and back, eme- rald green. Bill, crimson. Found in the valleys of dense evergreen Forest.
592. <i>Polioæetus</i> <i>ichthyaæetus.</i>	Bar Tailed Fishing Eagle.	The name မုန် ဝော် is also applied to this. Length 29"

THE CLIMATE OF BANGKOK.

BY

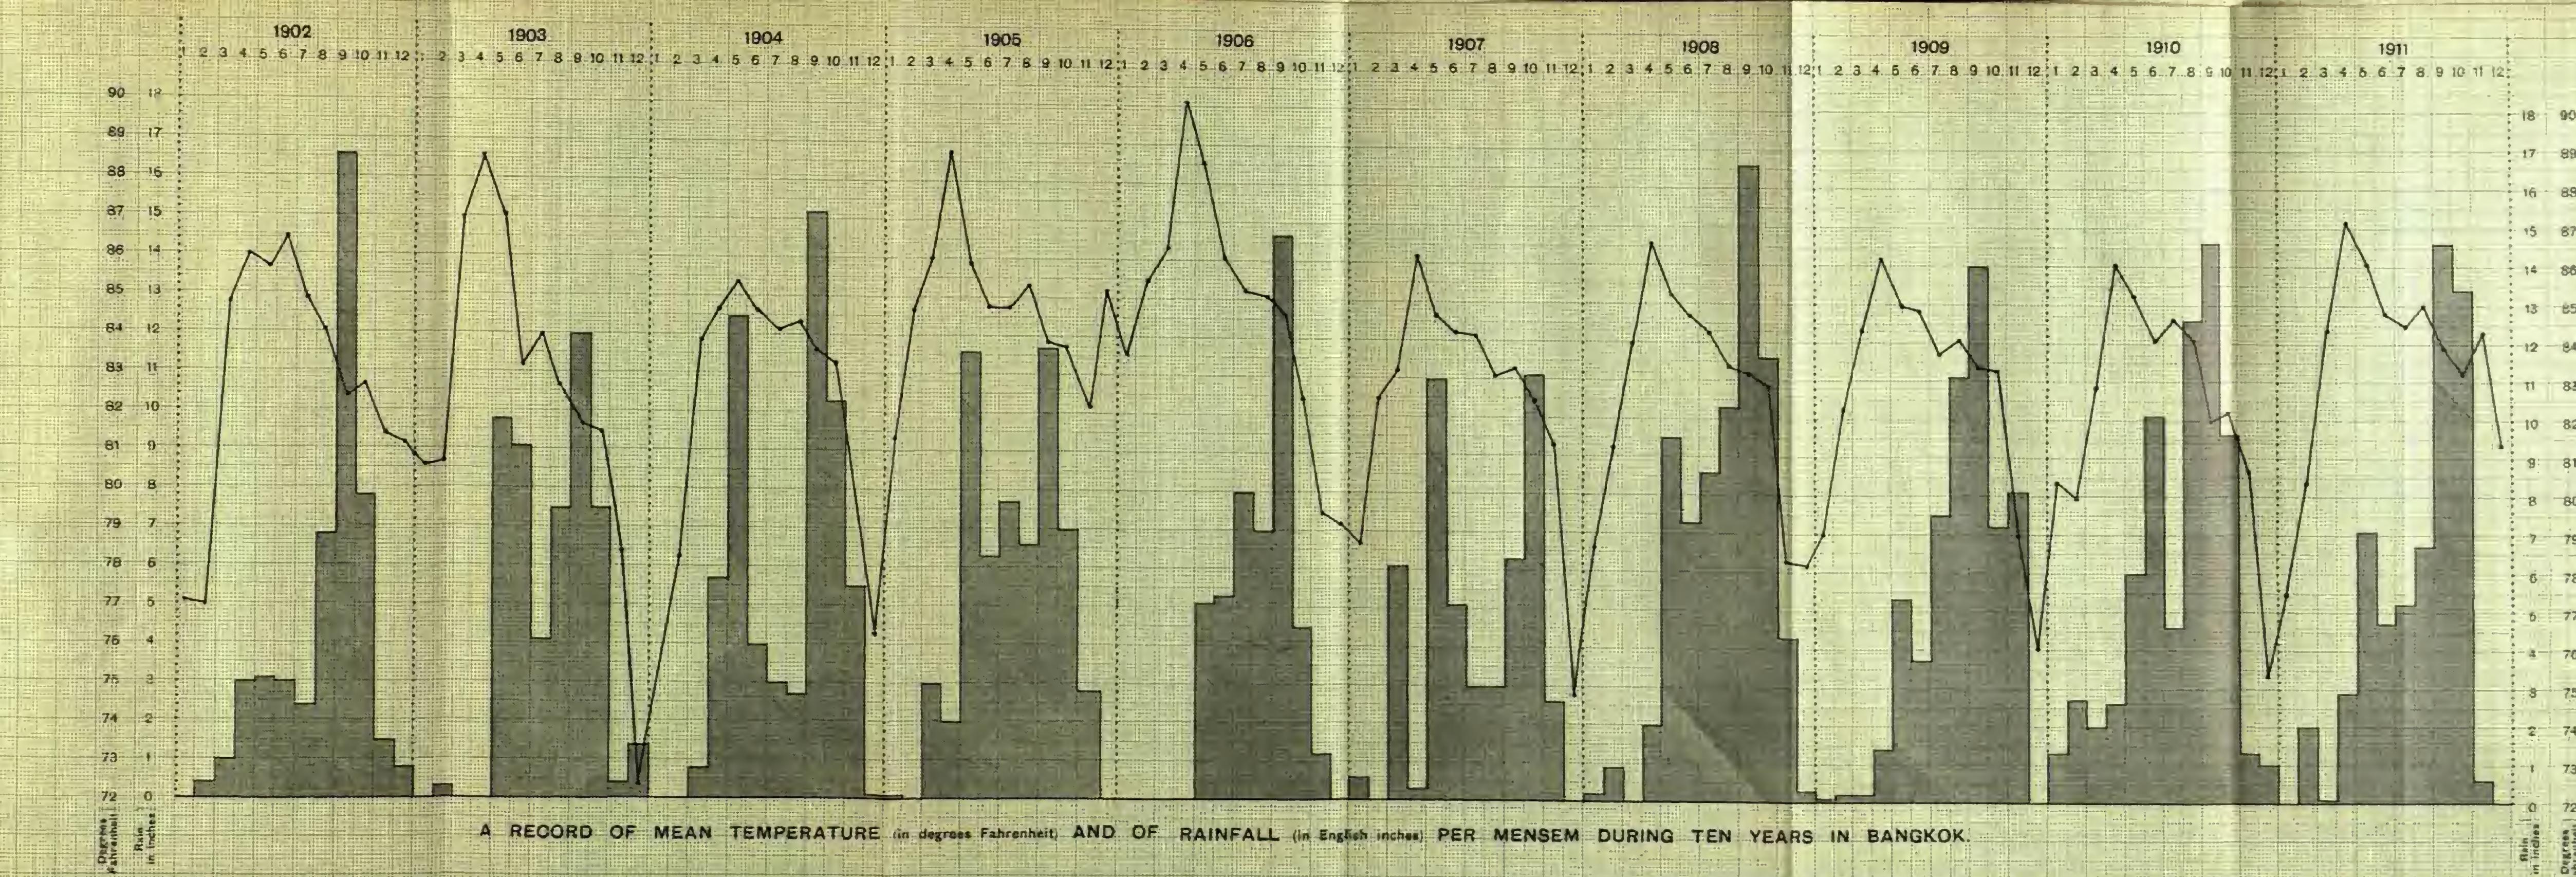

H. CAMPBELL HIGHET, C. M. ; M. D. ; D. P. H. ;

Principal Medical Officer Local Sanitary Department Bangkok,
Vice-President, Far Eastern Association of Tropical Medicine,

Fellow of the Royal Institute of Public Health.

Fellow of the Society of Tropical Medicine and Hygiene.

The Climate of Bangkok.

The following notes upon temperature and rainfall are offered as a small contribution towards the complete study of all the climatic conditions which obtain in the City of Bangkok. They are based upon daily records taken during the last ten years, that is 1902 to 1911 inclusive. During the majority of these years, the instruments have been located in the compound of the Police Hospital. The daily readings have been taken by Mr. G. A. Bryan, the Resident Surgeon, and I am glad to have this opportunity of thanking him for his very valuable assistance.

The thermometers are all "Kew-tested" and can be relied upon, and those for recording shade temperatures are kept in a double roofed louvered box, four feet above the ground, on the lawn of the hospital.

GENERAL CONSIDERATIONS.

Bangkok, the Capital of Siam, is situated on both banks of the river Menam Chow Phya, some forty Kilometers above the bar following the windings of the river, but only 22.5 Kilometres in a direct line from the bar, in latitude $13^{\circ} 58'$ N., and longitude $100^{\circ} 34'$ E.

The mean level of the city is only about 4.25 metres above mean sea level

The numerous canals which intersect it show a difference between ordinary high and low tides of only 1.8 metre and at Spring Tides of 2 metres.

During the high tides of November, December and January, considerable portions of the city are subject to inundation, especially during years of heavy rainfall.

The Monsoons naturally divide the year into a dry and a wet season. The South-West Monsoon is said to blow from April to September, but in Bangkok, its onset with the accompanying rains is

somewhat variable as may be shown by the following data giving the advent of the rains during the ten years under review:—

Approximate Dates upon which the Rains commenced.

Year	Date
1902	2nd May
1903	8th "
1904	2nd "
1905	11th "
1906	10th "
1907	2nd "
1908	10th "
1909	30th April
1910	11th May
1911	4th "

During several of these years, frequent showers during April preceded the real advent of the rains, and in fact about the 20th April, one or more heavy showers of rain accompanied by thunder may be expected. As a rule, from this date until the rains break, the climate of Bangkok is at its worst. The temperature during the twenty-four hours is high, the air is humid, and breezes are light or absent. The onset of the rains may be fairly sudden, and after several weeks of rainless hot days the first heavy shower often occurs during the night. This was particularly the case in May, 1903, when after a complete absence of rain during March and April, a fall of 4.5 inches was recorded from about 10 p.m. on the 7th. until 5 a.m. on the 8th. In Bangkok it may be said that the South-West Monsoon lasts from the end of April or beginning of May until the end of October, which period coincides with the rainy season. During this season, the temperature tends to be more uniform than during the dry season, the daily maxima are lower, the minima higher, and naturally the range is less, giving therefore a greater monotony of climate.

During November, the actual date varying considerably, the North-East Monsoon sets in in Bangkok, and may continue to blow fairly regularly during December and January and perhaps a greater

portion of February. It is during this period that our much appreciated "Cool Season" is experienced. In the minds of dwellers in Singapore and other adjacent countries, our cool season still remains somewhat of a myth. True it is that in some years, the temperature fails to fall to reasonable figures for a longer period than a week or two, but on the other hand during a normal December and January, the climate of Bangkok is a very agreeable one.

The mean temperature in the shade for the ten years is 82.98°F (28.3°C) while the highest figure in the shade was 106°F (41.1°C). This temperature was recorded during the year 1906 on four occasions, i. e. on the 26th February, the 8th and 19th April and the 7th May as may be seen from Chart I.

The lowest temperature in the shade was recorded on the 21st December 1907 and amounted to 52°F (11.1°C). We have thus an absolute range of shade temperatures of 54°F or 30°C .

The maximum of the daily solar radiation temperatures ranged from 169°F (76.1°C) on the 1st August 1911 to 82°F (27.8°C) on the 14th May 1908.

The mean rainfall for the ten years is 57.139 inches (1450.8 m.m.), the range being from 45.95 inches (1167.1 m.m.) in 1906 to 72.13 inches (1831.8 m.m.) in 1908. May and September are the two wettest months of the year as a rule.*

Hail fell on the 7th April 1904, a phenomenon which is said to occur only once in ten years in Bangkok.

Towards the beginning and the end of the South-West Monsoon, the frequent heavy showers of rain are usually preceded and accompanied by fairly strong winds and by thunder and lightning.

Typhoons are unknown in Bangkok, but on one occasion in the writer's experience, a tornado of limited area, but of considerable force, was experienced in Bangkok. This was on the 31st March 1911 when at about 1.30 p.m., heavy clouds were seen to bank up towards the North and North-East, and strong winds began to blow, at first from the North-East. The storm passed across the compound of the Police School with considerable violence but doing no damage at this time,

* See Charts I., II., III. and Frontispiece.

and then seems to have described a circle, passing westwards over the Suan Luang to Pomprab district, thence North-West to Nang Leng District, East to Khor Sua and back South-East to the Police School again when it seems to have attained its maximum violence. At the School there is a double row of three barracks running West and East each raised on wooden pillars ten feet from the ground. Of the northern row, barracks No. 1 and 2, counting from the Western end, were lifted from their foundations and overturned and the same fate befel No. 2 of the Southern row. Number one of this row was badly shaken and was left standing at a considerable angle from the perpendicular. All the other buildings were left intact although the nearest was less than fifty yards from those blown down.

Three men were killed by the falling buildings and over twenty constables sustained injuries of a more or less serious nature.

PREVIOUS METEOROLOGICAL RECORDS.

The only previous records of temperature and rainfall known to me are two, namely those compiled by the Rev. Jesse Caswell, an American Missionary, and those recorded by Dr. James Campbell—Physician to the British Legation. In the "Bangkok Calendar" for 1860, the Rev. Dr. D. B. Bradley, the Editor, writes as follows under the heading "Meteorological Tables":—

"The four following tables were prepared by the Rev. Jesse Caswell, formerly a Missionary of the A. B. C. F. M., but afterwards under the patronage of the American Missionary Association, New York. The compiler can testify from personal knowledge, that the observations were made with great care and labor, but for the want of a self-registering instrument, it was impossible for him to make them as accurate as the tables following them, made by Dr. Campbell."

In the same number of the Calendar, Doctor Campbell writes thus to Dr. Bradley.

Bangkok January 1st. 1859

My Dear Doctor,

"Enclosed I send you the various items I record, condensed into monthly tables and think them to be as copious as you will require for the object in view.

" The temperatures I believe to be the most correct of any recorded for Bangkok: for I take it those hitherto noted were not from self-registering instruments, or if so, that they were not so accurate as those now made.

" My thermometers were tested at Kew and Greenwich observatories. The same remarks apply to the Hygrometer."

With regard to the Rev. Mr. Caswell's data which cover the year 1840-47 inclusive, one cannot but commend the indefatigable labour and care taken in the recording of these figures.

In the absence of self-registering instruments, it is difficult to imagine how with his ordinary duties to perform, Mr. Caswell could find time to make such careful records. His mean temperature for eight years is 81.1° F, that of Dr. Campbell for 10 years 1858 to 1868 (circa), is 80.1° F, and my mean for 10 years 1902 to 1911 is 82.9° F, all closely approximating.

It may be further noted that Mr. Caswell's extremes were 97° F and 54° F, a range of 43° F, which is 11° F below my extreme range. Taken under such difficulties, it would be useless to form any definite conclusions upon Mr. Caswell's figures.

With regard to Dr. Campbell's data, however, the facts are reliable, taken as they were by a careful observer with self-registering instruments previously tested at Kew and Greenwich Observatories.

In a former publication on " Climate and Health in Bangkok" read before the Siam Society, I referred to ten years records of Dr. Campbell in the possession of the Royal Meteorological Society of England, and hazarded the opinion that considering their lesser range than my figures, the location of the instruments might possibly have been a shaded verandah in place of in the open air under the shade of the regulation double-roofed louvred box in which my instruments have always been kept.

Unfortunately, we have no records of Dr. Campbell's extremes of maxima and minima but on looking at Chart I, it will be seen that his figures show a lesser range generally than mine. The only exceptions are that his mean of minima for November and December are slightly lower than mine. There is a difference, too, in the rainfall.

averages (see Chart II) Dr. Campbell's being 67.04 inches, mine being 57.14 inches.

One might well ask has the climate of Bangkok changed during the last forty to fifty years?

The two periods in question are not long enough to enable one to make any reliable comparison, but it should be at least noted that the lesser range of temperature in Dr. Campbell's records is accompanied by a higher rainfall, while my ten years' averages give a higher range of temperature and a rainfall lower by ten inches.

If it could be proven that any great extent of destruction of forests had taken place during the past fifty years around Bangkok, then such a change in climate would be just what one would expect; for it is well known that in forest districts, the minima are constantly higher and the maxima constantly lower, and that the range is consequently less than in regions not covered with wood, and that the rainfall is greater than over ground bare of trees. Unfortunately I have been unable to obtain reliable data with regard to any extensive disafforestation in and around Bangkok within the period about mentioned. Until reliable records have been taken during many more decades, it will be impossible to make any emphatic statement as to any local change of climate.

To those who do not care to consult the tables of temperature and rainfall provided as appendices, the following abstract of the climatic conditions for each month may be of interest.

MONTHLY ABSTRACT OF CLIMATIC CONDITIONS IN BANGKOK.

January. The mean temperature in the shade is 79.⁰ F or 26.1⁰ C, the mean of the maxima 92.1⁰ F (33.3⁰ C), the mean of the minima 66.7⁰ F (19.3⁰ C), the mean daily range 25.4⁰ F (14.1⁰ C) while the mean solar radiation temperature amounts to 139⁰F (59⁰ C). During this month, the highest temperature in the shade was 100⁰ F (37.8⁰ C) during five days in 1906 and on one day in 1907 and the lowest in the shade 54.⁰ F (12.6⁰ C) on the 22nd., 1904. This is the month during which we experience the greatest mean daily range between the maximum and minimum shade temperatures. The maximum range for the month was 40.⁰ F (22.2.⁰ C) in 1907, while the minimum was 14.⁰ F (7.7⁰ C) in 1907.

This month is also marked by the least mean rainfall, the mean for the 10 years being 0.25 inch (6.4 millimetres). The average number of days on which rain falls is 1.5 and the greatest rainfall in any 24 hours during this month amounted to 0.98 inch (25. m.m.) and was recorded on the 24th., 1910.

As might be expected with such slight rain, the mean relative atmospheric humidity for the month is only 68 per centum.

The wind is generally from the N., N. N. E and sometimes S. S. W.—S.

February. The mean shade temperature is 81. 2° F (27. 3° C), the mean of the maxima 93° F (33.9° C), the mean of the minima 70.2° F (21.2° C), while the mean solar radiation figure is 138° F (58.8 C°). The extremes are 106° F (41.1° C) in the shade in 1906 and 56° F (13.3° C) in 1902.

The mean daily range is 22.7° F (12.6° C), less than January. The greatest range recorded during the ten years was that of 41° F. (22.7° C) on the 3rd February 1908.

During this month we also find the least range recorded—namely 3° F. (1.6° C) on the 4th of 1902. On the previous day, there had been a few drops of rain with a maximum of 84° F. in the shade. On this the 4th, rain fell in a drizzle to the extent of 0.4 inch. The solar radiation figure was only 87° F. (30.6° C), the maximum in shade 68° F. (20° C) and the mean for 24 hours 65.8° F. (18.7° C).

The mean rainfall is slightly over that of the previous month being 0.67 inch (17 m.m.) and the mean number of days on which rain falls is two. This rainfall is generally limited to a few slight showers—the well known "Mango Showers"—but occasionally quite a heavy fall has been recorded, as for example 1.65 inch (41.9 m.m.) on the 21st of 1911 and 2.47 inch (62.8 m. m.) on the 25th of 1910.

The mean relative atmospheric humidity is 60.4 %.

The wind blows from the N. E., E. or S. S. E. and rarely from the South.

March. Higher than in January, or February, the mean temperature is 84.7° F (29.3° C), the mean of maxima 94.7° F (34.8° C),

and the mean of minima 73.2° F (23° C), all shade readings. The mean solar radiation temperature is 143° F, the highest being 162° F in 1903 and the lowest 87° F in 1907.

The highest maximum in the shade was 108° F (39.4° C) on the 31st of 1903, the lowest minimum 62° F (16.7° C) on the 22nd of 1908.

The daily range is lessening, the mean being 20.6° F. (11.4° C) the greatest 37° F (20.5° C) and the least 7° F (3.7° C).

This is still a very dry month with a mean of 2.6 rainy days and a mean fall of 1.35 inch (34.3 m. m.).

The total amount for the month has varied during the ten years from *nil* in 1903 and 1906 to 6.18 inches in 1907. The highest fall on any one day was 2.62 inches (66 m.m.) on the 1st of 1907.*

The mean relative humidity is 62.8% .

The wind varies from the E. N. E., to N. E., S. S. E., and S., or S. S. W. The last mentioned is the "Lom Wow" or kite flying breeze which during this month begins to blow regularly throughout the day. The occurrence of a tornado during this month has already been referred to under "General considerations."

April is the hottest and most unpleasant month of the year. In the shade, the mean is 87° F (30.6° C), the mean of maxima 96.6° F (35.8° C) and the mean of minima 76.4° F (24.6° C). The mean solar radiation figure is 145° F (62.7° C) with a maximum for this month of 159° F (70.5° C) in the sun in 1910 and a minimum of 95° F (35° C) in the sun in 1908.

The extremes in the shade are 106° F (41.1° C) on the 7th in 1908 as a maximum and 68° F (20° C) as a minimum on the 6th in 1914.

The mean daily range is 20.1° F (11.1° C).

Rain falls on an average 5.1 days and the mean amount recorded is 2.03 inches (52 m.m.)

Here again the total fall has varied during the ten years from *nil* in 1903 to 5.71 inches (144.8 m.m.) in 1904. Whether

* See footnote to account for May.

showers may be recorded during the earlier part of the month or not, it may be taken as a regular thing that there will be a heavy shower or two from the 18th. to the 21st. after which the climate is oppressive and damp until the rains properly set in.

Hail fell on the 7th. of 1904, an incident which is said to take place once in ten years in Bangkok. On this day, there was nothing else unusual, the solar radiation being 148° F, the shade maximum 96° F and the mean for the day 84.8° F. As just mentioned above, this was our wettest April. The relative humidity was 62.2% in 1911.

The prevailing wind begins to change from the N. E. to the S. W.

May is the month when the South West Monsoon sets in properly in Bangkok and the rains break. In the general survey of the climate, it has been shown that in nine out of the ten years, the rains set in somewhere between the 2nd. and 11th. of the month.

The mean rainfall is 8.18 inches (206.5 m.m.) while the greatest amount for the month was 12.5 inches (318 m.m.) in 1904, and the least 3.15 inches (80 m.m.) in 1902. The average number of rainy days is 16.9.

The greatest rainfall recorded during any one day during these ten years was 4.5 inch (114.3 m.m.) on the 8th May 1903.*

The shade temperatures are as follows:—mean 85.9° F (30° C), mean of maxima 94.7° F (34.8° C), mean of minima 76.1° F (24.4° C), mean daily range 18.5° F (10.3° C), greatest daily range 30° F (16.6° C) and least daily range 5° F (2.7° C). The extremes range from 106° F (41.1° C) on the 7th. of 1906 to 72° F (22.2° C) on the 8th. of 1903 and the 4th, 14th and 26th. of 1904.

The mean maximum solar temperature is 145° F (62.7° C) with a maximum of 161° F (71.6° C) in 1910 and a minimum in the sun of 82° F (27.8° C) on the 14th. of 1908, the lowest figure recorded in the sun during the ten years.

* Since writing the above, the maximum rainfall on any one day has been exceeded by 0.7 inch. On the morning of the 31st March 1912, strong winds set in about 4 a. m. and were accompanied by heavy rain which started at about 4.45 a. m. and continued almost without intermission until 10 a. m. during which period a fall of 5.85 inches (185.9 m.m.) was recorded.

The prevailing winds are from the S. W. and S. and are gentle breezes as a rule, but every heavy shower, during this month, is usually preceded by strong winds which mark the month as one of squalls.

June. After the burst of the monsoon in May, the rains slacken off somewhat during June although the average number of rainy days is 17.4 just over that of the previous month.

The mean rainfall is 5.9 inches (149.9 m.m.), with a total of 10.18 inches (257 m.m.) in June 1910 falling to a total of 2.99 inches (76 m.m.) in 1902.

The greatest amount in any one day was 1.7 inch (43.2 m.m.) on the 2nd. of 1903.

The mean shade temperatures are:—

Mean 84.8° F (29.3° C), mean of maxima 92.6° F (33.6° C), mean of minima 76° F (24.4° C), mean daily range 16.5° F (9.1° C), greatest daily range 25° F (18.8° C) and least daily range 6° F (3.3° C).

The extreme shade temperatures were 100° F (37.8° C) on the 1st and 2nd of 1902, and the 20th of 1903, as maxima, and 70° F (21.1° C) as a minimum on the 10th of 1909.

The mean sun temperature is 143° F (61.5° C) with a maximum of 161° F (71.6° C) in 1911 and a minimum of 103° F (39.4° C) in 1903.

The average relative humidity is 69.4.%.

The wind remains steady from the S. W. though it occasionally veers to the W. or S.

July. Temperatures and rainfall show little variation from those of June.

The means in the shade are as follows:—absolute mean 84.4° F (29.2° C), mean of maxima 92.3° F (33.5° C), mean of minima 75.7° F (24.3° C) and mean daily range 16.6° F (9.2° C).

The extremes in the shade were a maximum of 101° F (38.3° C) on the 7th and 8th., 1908, a minimum of 71° F (21.7° C)

on the 12th 1908, and on the 8th, 1911, a maximum daily range of 25° F (13.8° C) on the 7th and 8th 1908, and on the 30th, 1910, and a minimum daily range of 8° F (4.4° C) on the 3rd, 1910.

The mean temperature of solar radiation for this month is 142° F (61.1° C), the highest in the sun being 161° F (71.6° C), in 1910 and in 1911 and the lowest 95° F (35° C) in 1907.

The mean rainfall is 5.43 inches (138 m.m) with a mean of rainy days of 17.2.

The highest rainfall recorded on any day was 1.9 inch (48.3 m.m) on the 25th of 1906.

The relative humidity for the month is 67.6 per cent.

The winds continue from the S. W.

August. Shows a distinct increase in rainfall, the mean being 7.45 inches (189.2 m.m.) with 18.6 as the average number of rainy days.

During the ten years, the rainfall has varied as much as from 2.8 inches (71.1 m.m.) in 1904 to 12.65 inches (321.3 m.m.) in 1910.

The greatest fall on any one day was 2.24 inches (57. m.m.) on the 28th of 1910. The relative humidity is 65.9 per cent.

The shade temperatures are:—mean 84.1° F (28.9° C), mean of maxima 92.1° F (33.3° C), mean of minima 75.5° F (24.2° C), mean daily range 16.5° F (9.1° C), the highest recorded being 99° F (37.2° C) on the 10th, 1906, the lowest 72° F (22.2° C) on the 9th, 1911, the greatest daily range being 24° F, (13.3° C) in 1906 and the least daily range being 6° F (3.3° C) in 1908.

In the sun, the mean is 141° F, (60.5° C) the highest being 169° F (76.1° C) on the 1st of 1911 which is the highest record in the sun during the ten years.

The lowest sun temperature for this month was 97° F (36.1° C) in 1908.

The breezes are still like those of July from the S. W.

September has been uniformly throughout these ten years the wettest month, the mean being 13.65 inches (346.7 m.m.). The

range has varied between 6.3 inches (160 m.m. in 1907 and 16.64 inches (422.4 m.m.) in 1902.

The mean of rainy days is 21.6 and the relative humidity 73.1 per cent. The greatest fall on one day was 3.7 inches (94 m.m.) on the 15th of 1909.

As for the temperature, the means in the shade are as follows:—absolute mean 83.2° F (28.4° C), mean of maxima 90.9° F (32.8° C), mean of minima 75.8° F (24.1° C) and the mean daily range 15.4° F (8.5° C). The extremes in the shade were:—highest 98° F (36.7° C) on the 7th. of 1906, lowest 70° F (21.1° C) on the 26th. of 1902, greatest daily range 24° F (13.8° C) on the 17th. of 1908, and the least daily range 6° F (3.3° C) on the 22nd. of 1908.

The temperature of solar radiation is 141° F (60.5° C) as a mean, while the maximum recorded was 161° F (71.6° C) in 1911, and the minimum in the sun was 90° F (32.2° C) in 1908.

The breezes nearly all come from the W. S. W., N. W., and S.

October. The rains are now lessening and in fact, although November may occasionally show a considerable rainfall, this month ends the real rainy season. The average fall for the ten years is 9.04 inches (229.5 m.m.) with a mean number of rainy days of 18.7, and a relative humidity of 74.1 per cent.

... The highest rainfall on one day was 2.75 inches (69.8 m.m.) on the 7th. of 1911.

Throughout the ten years, the total rainfall for the month has varied from 4.58 inches (123.2 m.m.) in 1906 to 13.41 inches (340.4 m.m.) in 1911.

The temperatures are generally slightly less than during the preceding month although the climate is still muggy and damp.

The shade temperatures are as follows:—mean 82.7° F (28.2° C), mean of maxima 90.8° F (32.7° C), mean of minima 74.8° F (23.8° C), mean daily range 16.1° F (8.9° C), highest recorded 100° F (37.8° C) on the 30th. of 1906, lowest recorded 64° F (17.8° C) on the 23rd. of 1906, the greatest daily range 27° F (15° C) on the 23rd. of 1906 and the least daily range being 5° F (2.7° C) on the 2nd. of 1903.

The mean temperature of solar radiation is 139° F, (59.4° C) the maximum being 163° F (72.7° C) in 1910 and the minimum in the sun being 86° F. (30° C) in 1903.

Towards the end of the month, the winds are variable and may blow from the N. N. W., E. S. E., or W. until the N. E. monsoon is established.

November. The North-East monsoon sets in during this month. If early, the month is a very pleasant one with bright clear skies, cool nights and still cooler mornings. In Bangkok, however, the break of the monsoon may be delayed till the end of this month, the wind occasionally blowing from the S. W. and making it, therefore, a very hot and unpleasant period.

A few showers of rain still tend to fall during the early part of the month, the mean fall being 2.84 inches (72.4 m.m) and the mean number of rainy days being 5.8. The highest record on one day was 2.75 inches (69.8 m.m.) on the 4th of 1905. During the ten years under review, the rainfall for this month has varied from 0.4 inch (10.2 m.m.) in 1903 to as much as 8.14 inch (207 m.m) in 1909.

It is well, however, to have all water tanks filled up by the end of October.

The temperature records show an improvement during this month, the mean shade reading being 80.4° F (26.9° C). The other shade temperatures are as follows:—mean of maxima 89.3° F (31.8° C), mean of minima 71.3° F (21.8° C), the mean daily range 18.5° F (10.8° C), the highest reading being 99° F (37.2° C) in 1907 and the lowest 56° F (13.3° C) in 1906, the greatest daily range 31° F (17.2° C) on the 18th November 1906, and the least daily range 6° F (3.3° C) on the 28th of 1909.

In the sun, the mean maximum is 138° F (58.8° C) with an actual maximum of 160° F (71.1° C) in 1909 and an actual minimum of 100° F (37.8° C) in 1903.

The relative humidity is 68.2 per cent.

December is the coolest month of the year, showing a mean temperature of 78° F (25.6° C) in the shade. The other shade readings are these—mean of maxima 88.9° F (31.6° C), mean of minima 66.8° F (19.8° C), mean daily range 22.1° F (12.2° C), highest recorded being 100° F (37.8° C) in 1906 and the lowest being 52° F (11.1° C) the actual lowest record during these ten years. This was on the 21st. December 1907, and was followed on the 22nd. and 23rd. of the same month by readings of 53° F (11.7° C) and 56° F (13.3° C) respectively.

A minimum of 53° F was again registered on the 26th of 1910. The extremes of daily range vary from 33° F (18.3° C) in 1906 to 6° F (3.3° C) in 1904.

The maxima in the sun give a mean of 137° F (58.3° C) and a range between 157° F (70° C) and 90° F (32.2° C). The mean rainfall is only 0.87 inches (9.5 m.m.) with a mean of 1.7 rainy days and a relative humidity of 66.7 per cent. The greatest rainfall on one day was measured on the 15th of 1903 and amounted to 0.92 inch (23.4 m.m.).

Although the N. E. monsoon prevails, yet the wind is often from the E., S. S. E., and S. and sometimes as far round as the S. S. W. when the clear dry weather typical of this month gives place to cloudy and warm weather accompanied by a few showers

APPENDICES.
